

Swing Over

*The one-for-two
milking installation*

- *High-line milkline*
- *One cluster for two milking units*
- *Detachers or milk meters*
- *Stainless steel arm*
- *Ease of use*

The Swing-Over design combines performance and reduced cost. It requires only half the number of clusters, detachers and pulsators.

- The Swing-Over set-up suits any type of milking parlour and is available :
 - without detachers
 - with detachers (Isolator XP)
 - with milk meters MR 2000

- The pivoting arm at the pit centreline supports the detacher cylinder and the cluster assembly. With this design, the equipment can be used on both cow platforms in alternation, reducing the cycle time between two milking strings when cows leave and enter.

- The Swing-Over arm does not need any additional masonry work and does not disturb the milker, since it is located overhead. The equipment is kept out of water spray and shocks, flushing the platforms and the milker pit is much easier for the operator.

High-line assembly :

- Milkline
- Pulsators
- Pulsation line
- Detachers
- Milk meters
- etc
